HUNGARIAN, SUMERIAN AND INDO-EUROPEAN

"Etymological Dictionary of Hungarian" (EDH) is dedicated to the blessed memory of my unforgettable teacher and friend Prof. Dr. Linus Brunner (1909-1987), in occasion of the 20th anniversary of his death on 3rd of December 2007.

1. Introduction

Herewith I present the fourth and last part of my “Etymological Dictionary of Hungarian” (EDH), three parts of which with over 1000 pages have already been published in the last months. In the following, I will deal with the genetical relationship of Sumerian-Hungarian with the Indo-European (IE) languages. As it was already proved in EDH-1 to EDH-3, Sumerian survived not only in Hungarian, but in a few dozens of language families with several languages all around the world. Therefore, it is to assume that Sumerian is still present also in the IE languages. In order not to confuse more than necessary the sound-equations, I will give basically examples of Sanskrit, Old Greek, Latin and, instead of Gothic, German and English words that are related to Sumerian-Hungarian words. Since Linus Brunner had already proved in 1969 that at least 1030 roots are common in the IE and the Semitic languages, I will also show word equations from Akkadian, Hebrew, Arabic, and other languages in order to show the genetical relationship between Sumerian, IE and Semitic, that includes, of course, the relationship of the Finno-Ugric languages (FU), too.

The Hungarian-Latin examples are taken from the book by Szabédi, who has given extensive sound-laws to prove that, according to him, the FU languages belong to the IE language family. Later attempts to prove the genetical relationship between FU and IE languages include works of Björn Collinder and Jochem Schindler, who did not, however, refer to Szabédi’s thorough study. Here, I will show, that this relationship elaborated by Szabédi is only due to the bigger relationship of FU, IE (and Semitic) with Sumerian. I would like to remember that the Sumerian-Hungarian language relationship has already been proved by Gostony (1975) and in EDH-1, chapter 5. Since Szabédi has no word list, I have given all references to his book. Because Szabédi deals amongst the IE languages only with Latin, I have given from Walde and Hofmann (1938-56), Hofmann (1950) and Kluge (2000) all Sanskrit, Greek, Latin, German and English cognates. The Semitic examples are taken from Brunner (1969). I would like to point out again, that all these reference works are based strictly on sound-laws. And like in the former chapters of EDH, I compare here not two, but always more than two languages with one another, since the intersection set of common cognates of several languages excludes change much more than the intersection set of only two languages.

3. Conclusions

Sumerian-Hungarian and IE have 607 of 1042 = 58.3% of our basic word list (EDH-1, chapter 5) in common. This is the second-highest genetical relationship amongst the dozens of languages scrutinized in EDH. The order thus presents newly as follows (cf. EDH-1, chapter 18):

Hungarian (100%) > Chinese (61%) > **IE (58.3%)** > Turkish (55%) > Tibeto-Burman (ca. 50%) > Dravidian (36%) > Munda (33%) = Etruscan (ca. 33%) > "FU" languages (31.9%) > Japanese (23%) > Mayan (11%) > Bantu (8%) > Caucasian (7%) > Austronesian (incl. Mon Khmer, Australian and Tasmanian) (3%).

Since the IE relationship with Sumerian-Hungarian is higher than Turkish – the highest of the so-called Altaic language family –, this proves that like the alleged FU language family also the concept of an "Altaic" language family can be abolished. Given the high percentage of relationship between Sumerian-Hungarian and all basic language families of the world, the traditional language families may turn out as Sprachbünde, but not longer as Sprachfamilien. Why Chinese has the strongest relationship with Sumerian-Hungarian, has to be researched, however.

Furthermore, Sumerian-Hungarian and IE have 203 of 607 = 33.4 % of their vocabulary in common with Semitic languages. In this unexpectedly high percentage we will find a lot of lost Raetic words, since the Raeti, the ancestors of the Retoromans and the only indigeneous Semitic Europeans (cf. Tóth and Brunner 2008), as well as the Sumerians, the ancestors of the Hungarians and of many other peoples, came from Babylonia. This is shown already in traditional historical linguistics by the several Sumerian borrowings in Akkadian as well as by the many Akkadian borrowings in Sumerian. It may therefore not be by chance that the names of the rivers Drau (Brunner 1969, no. 665) and Danube (Brunner 1969, no. 707) have a common Sumerian-FU-IE-Semitic origin.

Most of all and generally speaking about EDH, the ten-thousands of common words I have shown in my dictionary establish a genetical relationships that does not need the artificial construct of a macrofamily like Nostratic that implies a much bigger language-depth of the supposed proto-language and does not lead to the questions how far one can go back with language reconstruction and how old human language is after all. From history it is clear that the big exodus (or exodoi) of the Sumerians started with the Akkadian attack against Sumeria in the 17th century B.C. The Raeti left their homeland about in the 13/12th century. No need therefore to assume a common proto-language of Sumerian, FU, IE and Semitic for at least the 20th millennium B.C. Sumerian is testified from the 6th millennium B.C. until the last centuries B.C. and is – unlike the artificial proto-languages like proto-IE, proto-FU and proto-Semitic, a real language conserved in ten-thousands of documents written in clay. In EDH, we have only compared languages from dictionaries that work with sound-laws. Starting with the Sumerian clay tablets and using these sound-laws we therefore have a maximally complete documentation of all word-forms in EDH from Sumerian until today. Geneticists therefore can use the results of EDH as well, since they are obviously unable to deal with genetical relationships that are older than the ones shown in EDH.
